MAKING AN INFORMED CHOICE IN TEETH ALIGNMENT

Technological advancement in computer-aided design and manufacturing (CAD/CAM), coupled with application of 3D printing in the field of dentistry, has presented us with more choices in teeth alignment than ever before. Aside from conventional metal braces, ceramic braces, self-ligation braces, and clear aligners are commonly offered options in most orthodontic clinics.

As we are bewildered by the plethora of advertisements in teeth alignment options, how do we make an informed decision about which is the most suitable for us?
